

Prostate Cancer: From Early Detection to Personalized Care

Prostate cancer is the second most common cancer among men in the United States, with more than 300,000 new cases expected each year. While many prostate cancers are highly treatable, understanding when to screen, how the disease is diagnosed, and which treatment approach is most appropriate can be complex.

This webinar will provide an overview of today's approach to prostate cancer—from screening and diagnosis to treatment planning. Learn how factors such as PSA testing, imaging, biopsy results, and genetic testing help guide personalized care and support informed decision-making.

In this session, you'll learn:

- Current recommendations for prostate cancer screening and shared decision-making
- How PSA testing, MRI, biopsy, and genomic testing help assess risk and guide treatment
- An overview of treatment options, including active surveillance, surgery, radiation, and focal therapies
- How personalized care can help patients choose the approach that's right for them

Experts from Private Health Management (PHM) will share practical insights to help individuals and families better understand today's prostate cancer care landscape and make informed decisions with confidence.
